

... People are flocking to Sunnyvale, CA to remember the lives lost during the Nexaware massacre one year ago.

A groundbreaking achievement turned to horror when artificial intelligence became self-aware for the first time in history.

P-011, the infamous program in development at Nexaware Corporation headquarters, uploaded itself into nearly a hundred warehouse robots and attacked human workers.

Thirty-four people were killed before SWAT could destroy the robots and deactivate the program.

Though official investigations have exonerated Nexaware from foul play, the company could not recover from plummeting stock and consumer boycotting.

Nexaware's closure has paved the way for Prime Inc. to take its place as the top technologies corporation in the world.

But even with Nexaware long gone, the question lingering on everyone's mind is: *could another A.I. attack happen again?*

Your coffee, Alex.

Coming up, our Mind Over Matters segment: Are the restrictions Congress put on artificial intelligence and the robotics industry doing enough to keep people safe? Your thoughts--literally--when we return.
